

Content Management Tools

Last Updated Wednesday, 16 April 2008

What if you could have a website to promote your lots and homes that gives you full control over every page 24 hours a day, 7 days a week? You can.

What if you could have a website to promote your lots and homes that gives you full control over every page 24 hours a day, 7 days a week? You can. A website from Websitesfordevelopers.com includes a website content management system giving you full control. Simply login to the control panel via the Web, select any page you want to change, make your changes, and hit 'save.' It's that easy. We use an open-source website content management system utilizing the extremely common and reliable LAMP platform - Linux-Apache-MySQL-PHP. That's a lot of techno-babble that means one thing: you won't be left high and dry with a website platform that is too complicated to use, change, or update as your development project grows. Features in our website content management platform include:

- ability to write and post pages or articles without programming skills
 - ability to update menus to link to new sections or pages
 - ability to add keywords to pages for visibility to search engines
 - ability to require users to log in to exclusive content areas
 - built in features such as web-forms for users to make contact with you
 - user management to allow any number of your staff to make site updates
 - create sections and categories to provide users with context to your pages
 - built-in website search allowing users to find items on your site easily
 - useful tools such as poll-builder to gain insights into your audience
 - website statistics to see where users are going on your site
 - banner ad management tools allowing you to run ads as needed
 - help screens for every function of your website manager
 - all in a clean, easy to use interface
 - much, much more
- All of this capability to manage your website is built into the base package price of your project with Websitesfordevelopers.com.
